

Introducing **Genesis Pellet Stoves**

By Seraph Industries LLC

Heating Your Home with Renewable Fuels

“Seraph Pellet Stoves are an American story. Our vision of building a stove that would burn just about any type of grain or pellet fuel was born in the Midwestern winter as we sought an economical solution to our costly winter heating bills. Now, seven years later, our pellet stove is a true bio-fuels burner with the capability of burning virtually every natural or mechanically pelletized fuel available on the market today. All of our stoves are built right here in America. And although our stoves are not the cheapest stoves available, they are top quality, built to last and produce more heat for your money. We know you’ll enjoy years of warmth and comfort when you rely upon a Seraph Genesis Pellet Stove to heat your home.”

- Vance Hirst, Sr.
Cofounder

The Genesis Stoves are EPA-certified wood heating appliances, independently tested. The Seraph Genesis stoves output 2.1 grams per hour - 75% lower than the EPA standard. Our efficiency rating is 83.2%, nearly the highest in the industry.

The WH mark is a certification mark issued by Intertek demonstrating product safety and performance compliance. The Genesis 106 & 108 stoves have been tested, investigated and comply with the requirements of the Standard(s) for Space Heaters for Use with Solid Fuels (CAN/ULC-S627) and the Standard(s) for Pellet Fuel-Burning Type 1 Room Heaters (ASTM-E1509).

Efficient, economical home heating just got better.

Genesis Pellet Stoves let you decide the type of bio-fuel you burn, giving you ultimate control of the thermostat and your money. Our programmable, state-of-the-art controller is easily adaptable to burn virtually any bio-fuel available.

Extra Large Heat Exchanger for Maximum Efficiency. The Genesis fire box and extra-large stainless steel heat exchange tubes combine to produce a superior convection heating system, putting more heat where you want it - in the house. The Genesis 108 produces up to 65,000 BTUs to easily and safely heat homes as large as 2,800 sq. ft., depending upon floor layout, insulation and geographic location.

80-Pound Feed Hopper. The Genesis 108's large hopper reduces the need for frequent refueling, with 24-48 hour burn times compared to 6-7 hours for traditional wood-burning stoves. An optional attachment expands the hopper to a 120-pound capacity with up to 36-72 hours between refueling.

Seraph Multi-Controller. The genius of the Genesis 108 is the state-of-the-art electronic controller. No matter the bio-fuel, the controller is easily programmed for maximum efficiency. Change fuels -- no problem. Simply the best controller on the market today.

Seraph's Advanced Burn Process. Our patent-pending burn process, coupled with our state-of-the-art computer controller, assures maximum combustion and efficient ash removal from the unique rotating burn pot.

Large Ash Collection Pans. The Genesis 108's large ash collection pans, combined with its easy-clean design make clean-up and ash disposal a once-a-month job, depending upon the fuel burned.

Direct Venting and Easy Installation. The Genesis 108's 3" vent pipe can be easily vented through the wall. The direct venting system and negative draft combustion allows the stove door to be opened without the concern of smoke escaping into the home. There is no need for costly chimney installations.

A True Bio-Fuel Stove. Most pellet stoves burn one or two fuels. The Genesis stoves allow you to burn the entire range of natural and mechanically pelletized bio-fuels including shell corn, grass pellets, wood pellets, cherry pits, crop waste pellets, waste paper pellets and other organic materials.

Designer Colors. Put off by the "big black wood stove"? Not a problem. Our state-of-the-art paint system creates beautiful finish designer colors.
